2.1.5 Salmonella serovars and phagetype distribution

The methods of collecting, isolating and testing of the Salmonella isolates are described in the chapters above respectively for each animal species, foodstuffs and humans. The serotype and phagetype distributions can be used to investigate the sources of the Salmonella infections in humans. Findings of same serovars and phagetypes in human cases and in foodstuffs or animals may indicate that the food category or animal species in question serves as a source of human infections. However as information is not available from all potential sources of infections, conclusions have to be drawn with caution.

### Explanation
- **Antimicrobials**: A list of antibacterial agents tested against S. Typhimurium.
- **Cut-off values**: Threshold concentrations for each antimicrobial.
- **N**: Number of isolates with no resistance.
- **n**: Number of isolates with resistance.
- **Concentration (µg/ml)**: The concentration of each antimicrobial that inhibited the growth of the isolate.

#### Notes:
- **Cut-off value** represents the concentration threshold for sensitivity.
- **N** is the number of isolates tested.
- **n** indicates the number of isolates within each concentration range.
- **<=0.002** and **<=0.004** refer to minimal inhibitory concentrations.
- **0.008** to **2048** denote concentration levels in µg/ml.

S. Virchow

- Isolates out of a monitoring program (yes/no)
- Number of isolates available in the laboratory

Antimicrobials:

- Aminoglycosides - Gentamicin
- Aminoglycosides - Kanamycin
- Aminoglycosides - Streptomycin
- Amphenicols - Chloramphenicol
- Amphenicols - Florfenicol
- Cephalosporins - Cefotaxime
- Fluoroquinolones - Ciprofloxacin
- Penicillins - Ampicillin
- Quinolones - Nalidixic acid
- Tetracyclines - Tetracycline
- Trimethoprim
- Cephalosporins - Ceftazidim
- Sulfonamides - Sulframethoxazole

**Comments:**

1) Staphylococcal enterotoxins A,B,C,D and E not detected

2) Staphylococcal enterotoxins A,B,C,D and E not detected

3) g and i genes detected

4) g and i genes detected
5. FOODBORNE

Foodborne outbreaks are incidences of two or more human cases of the same disease or infection where the cases are linked or are probably linked to the same food source. Situation, in which the observed human cases exceed the expected number of cases and where a same food source is suspected, is also indicative of a foodborne outbreak.
A. Foodborne outbreaks

System in place for identification, epidemiological investigations and reporting of foodborne outbreaks

National web based system for reporting outbreaks of all human infectious disease (notifiable and non-notifiable). Case based data can be linked to individual outbreaks.

Description of the types of outbreaks covered by the reporting:

Outbreaks of all human infectious disease (notifiable and non-notifiable). Case based data can be linked to individual outbreaks.

National evaluation of the reported outbreaks in the country:

Descriptions of single outbreaks of special interest

Outbreaks of special interest during 2010:

Salmonellosis outbreak associated with raw milk -

Salmonellosis outbreak associated with duck eggs -
http://www.lenus.ie/hse/bitstream/10147/129310/1/iss4duckegg.pdf

Control measures or other actions taken to improve the situation

Control measures resulting from Salmonellosis outbreak in duck eggs:

a. Production of "Code of Practice for Duck Table Egg Producers"

b. Production of "Guidelines for Producers of Small Quantities of Duck Eggs (Backyard Flocks)"

c. Production of "The Diseases of Animals Act 1966 (Control of Salmonella in Ducks) Order 2010 (S.I. No. 565 of 2010)."

d. FSAI issued point of sale notice

e. SafeFood to develop further communication for public
