Cyprus 2005  Report on trends and sources of zoonoses
This report is submitted to the European Commission in accordance with Article 9 of Council Directive 2003/99/EC. The information has also been forwarded to the European Food Safety Authority (EFSA).

The report contains information on trends and sources of zoonoses and zoonotic agents in Cyprus during the year 2005. The information covers the occurrence of these diseases and agents in humans, animals, foodstuffs and in some cases also in feedingstuffs. In addition the report includes data on antimicrobial resistance in some zoonotic agents and commensal bacteria as well as information on epidemiological investigations of foodborne outbreaks. Complementary data on susceptible animal populations in the country is also given.

The information given covers both zoonoses that are important for the public health in the whole European Community as well as zoonoses, which are relevant on the basis of the national epidemiological situation.

The report describes the monitoring systems in place and the prevention and control strategies applied in the country. For some zoonoses this monitoring is based on legal requirements laid down by the Community Legislation, while for the other zoonoses national approaches are applied.

The report presents the results of the examinations carried out in the reporting year. A national evaluation of the epidemiological situation, with special reference to trends and sources of zoonotic infections, is given. Whenever possible, the relevance of findings in foodstuffs and animals to zoonoses cases in humans is evaluated.

The information covered by this report is used in the annual Community Summary Report on zoonoses that is published each year by EFSA.

---

# LIST OF CONTENTS

1. ANIMAL POPULATIONS................................................................. 1

2. INFORMATION ON SPECIFIC ZOONOSES AND ZOONOTIC AGENTS.................. 3

## 2.1. SALMONELLOSIS
1. General evaluation of the national situation.......................................... 4
2. Salmonella in foodstuffs........................................................................ 5
3. Salmonella in animals........................................................................... 20
4. Salmonella in feedingstuffs................................................................. 39
5. Salmonella serovars and phagetype distribution...................................... 39
6. Antimicrobial resistance in Salmonella isolates........................................ 40

## 2.2. CAMPYLOBACTERIOSIS
1. General evaluation of the national situation............................................ 50
2. Campylobacter, thermophilic in foodstuffs............................................. 51
3. Campylobacter, thermophilic in animals................................................. 53
4. Antimicrobial resistance in Campylobacter, thermophilic isolates............... 54

## 2.3. LISTERIOSIS
1. General evaluation of the national situation........................................... 64
2. Listeria in foodstuffs............................................................................. 65
3. Listeria in animals................................................................................. 66

## 2.4. E. COLI INFECTIONS
1. General evaluation of the national situation............................................ 67
2. Escherichia coli, pathogenic in foodstuffs.............................................. 68
3. Escherichia coli, pathogenic in animals.................................................. 68

## 2.5. TUBERCULOSIS, MYCOBACTERIAL DISEASES
1. General evaluation of the national situation.......................................... 70
2. Mycobacterium in animals..................................................................... 71

## 2.6. BRUCELLOSIS
1. General evaluation of the national situation............................................ 79
2. Brucella in foodstuffs............................................................................ 81
3. Brucella in animals................................................................................ 81

## 2.7. YERSINIOSIS
1. General evaluation of the national situation.......................................... 93
2. Yersinia in foodstuffs............................................................................ 94
3. Yersinia in animals................................................................................ 94

## 2.8. TRICHINELLOSIS
1. General evaluation of the national situation.......................................... 96
2. Trichinella in animals............................................................................ 96

## 2.9. ECHINOCOCOSIS
1. General evaluation of the national situation.......................................... 97
2. Echinococcus in animals...................................................................... 98

## 2.10. TOXOPLASMOSIS
1. General evaluation of the national situation......................................... 99
2. Toxoplasma in animals.......................................................................... 100

## 2.11. RABIES
1. General evaluation of the national situation......................................... 101
2.11.2. Lyssavirus (rabies) in animals 102
3. INFORMATION ON SPECIFIC INDICATORS OF ANTIMICROBIAL RESISTANCE 104
   3.1. ESCHERICHIA COLI, NON-PATHOGENIC 105
      3.1.1. General evaluation of the national situation 105
      3.1.2. Antimicrobial resistance in Escherichia coli, non-pathogenic isolates 105
4. FOODBORNE OUTBREAKS 107
1. ANIMAL POPULATIONS

The relevance of the findings on zoonoses and zoonotic agents has to be related to the size and nature of the animal population in the country.

A. Information on susceptible animal population

Sources of information:
The information furnished derives from the Veterinary Services' database.

Dates the figures relate to and the content of the figures:
The numbers represent the number of animals at the end of 2005.

Geographical distribution and size distribution of the herds, flocks and holdings:
The animal population is allocated as follows:
Bovine Herds:
- 63 Herds with 1-5 animals,
- 19 herds with 6-10 animals,
- 22 herds with 11-25 animals,
- 14 herds with 26-50 animals,
- 26 herds with 51-100 animals,
- 94 herds with 101-200 animals,
- 47 herds with 201-300 animals,
- 70 herds with more than 301 animals.
The Total number of bovine herds is 355.
The Total number of Sheep and Goat flocks is 4152.

(6): 3 flocks are comprised solely of turkeys
5 flocks are comprised of both turkeys and chicks raised exclusively for Christmas
and 2 flocks are comprised of turkeys raised exclusively for Christmas
2. INFORMATION ON SPECIFIC ZOONOSES AND ZOONOTIC AGENTS

Zoonoses are diseases or infections, which are naturally transmissible directly or indirectly between animals and humans. Foodstuffs serve often as vehicles of zoonotic infections. Zoonotic agents cover viruses, bacteria, fungi, parasites or other biological entities that are likely to cause zoonoses.
2.1. SALMONELLOSIS

2.1.1. General evaluation of the national situation

A. General evaluation

History of the disease and/or infection in the country

Over the last years a surveillance program has been applied by the Veterinary Services covering the poultry sector. Foods of animal origin are examined for Salmonella on a regular basis.

National evaluation of the recent situation, the trends and sources of infection

Nowadays data exist for poultry and foods of animal origin.
2.1.2. Salmonella in foodstuffs

Additional information
NO DATA AVAILABLE
2.1.4. Salmonella in feedingstuffs
2.1.5. Salmonella serovars and phagetype distribution
2.1.6. Antimicrobial resistance in Salmonella isolates

The methods of collecting, isolating and testing of the Salmonella isolates are described in the chapters above respectively for each animal species, foodstuffs and humans. The serotype and phagetype distributions can be used to investigate the sources of the Salmonella infections in humans. Findings of same serovars and phagetypes in human cases and in foodstuffs or animals may indicate that the food category or animal species in question serves as a source of human infections. However as information is not available from all potential sources of infections, conclusions have to be drawn with caution.

A. Antimicrobial resistance in Salmonella in cattle

Sampling strategy used in monitoring
- Frequency of the sampling
  NO DATA AVAILABLE
- Type of specimen taken
  NO DATA AVAILABLE

2.5. TUBERCULOSIS, MYCOBACTERIAL DISEASES

2.5.1. General evaluation of the national situation

A. Tuberculosis General evaluation

History of the disease and/or infection in the country

Tuberculin test campaigns have been applied since 1970 on all bovines over the age of six months. No case of TB has been found in Cyprus since 1970. The 1975 campaign was assisted by FAO's epizootiologist Dr. Petar Markovic. Since 1986, tuberculin test has been applied only on bovines over the age of 24 months. Records indicate that tests on herd level were performed during the following periods: 1982-83, 1986-87-88, 1994-95, and 2000-2001. The records prove that the animals which have initially reacted positively or inconclusively to the tuberculin test were retested according to Directive 64/432/EEC provisions and all proved to be negative. Animals to enter the herds did not require testing for tuberculosis as these animals were originating from herds located in the territory controlled by the Republic of Cyprus; thus, regularly tested for TB. All slaughtered animals and their carcasses are necrotomically checked prior to being given to the meat industry for human consumption for possible presence of TB lesions. An island tuberculin test campaign began in 2004 according to Directive 64/432/EEC provisions. In 2004, 6937 animals were tested from 82 holdings of which none gave positive reaction. Two animals which reacted to the single intradermal test, had finally proved to be negative after the conduction of the intradermal comparative test. In 2005, 38779 animals were tested from 215 holdings. 122 holdings were assigned the Officially Free Status. In 2005, none animal has reacted positively to the single intradermal testing.

National evaluation of the recent situation, the trends and sources of infection

During 2004, 6931 animals were tested from 81 holdings of which none gave positive reaction. Two animals which reacted to the single intradermal test had proved to be negative after the conduction of the intradermal comparative test. In 2005, 38779 animals were tested from 215 holdings. 122 holdings were assigned the Officially Free Status. In 2005, none animal has reacted positively to the single intradermal testing.

Recent actions taken to control the zoonoses

A national tuberculin test campaign has begun in August 2004 according to Directive 64/432 provisions. This program aims to examine all bovines over the age of six weeks and to assign to all the herds the Officially Free Status.
2.5.2. Mycobacterium in animals

A. Mycobacterium bovis in Bovine Animals

Status as officially free of bovine tuberculosis during the reporting year

The entire country free

122 out of 330 holdings have been assigned the Tuberculosis Officially Free Status in 2005.

Free regions

Paphos' District holdings, 39 in total have been recognised as Tuberculosis Officially Free.

Monitoring system

Sampling strategy

All animals above the age of six weeks are tested for TB. In order to be assigned the Tuberculosis Officially Free Status a herd must undergo two tuberculin tests within a minimum of a six months time interval.

Frequency of the sampling

In order to be assigned the Tuberculosis Officially Free Status a herd must undergo two tuberculin tests within a minimum of a six months time interval.

Type of specimen taken

Blood

Methods of sampling (description of sampling techniques)

As described in Annex A of the EU Directive 64/432/EK

Case definition

If an animal yields a positive reaction to the single intradermal test (Bovine tuberculin) it is further examined with the comparative intradermal test (Bovine and Avian tuberculin). If it yields a positive reaction to the second test it is considered positive; the animal is slaughtered, necrotomically examined for tuberculosis' lesions and samples are taken for laboratory in order to detect M. bovis in the case of positive necrotomical findings.

Diagnostic/analytical methods used

1) Single and comparative Tuberculin skin tests (Bovine and Avian tuberculin)
2) Post-mortem examination.
3) Microbiological examination.

Vaccination policy
Following the completion of the first tuberculin test no animal over six weeks old is allowed to enter the herd, unless it reacts negatively to an intradermal tuberculin test carried out either 30 days prior to the movement or 30 days after its introduction into the herd.

**Other preventive measures than vaccination in place**

Following the completion of the first tuberculin test no animal over six weeks old is allowed to enter the herd, unless it reacts negatively to an intradermal tuberculin test carried out either 30 days prior to the movement or 30 days after its introduction into the herd.

**Control program/mechanisms**

**The control program/strategies in place**

The control program aims to examine all bovines over the age of six weeks according to Directive 64/432 provisions. The main objective of the program is to assign to bovine herds the Bovine Tuberculosis Officially Free Status (TBOFS).

**Recent actions taken to control the zoonoses**

Testing, monitoring and surveillance.

**Measures in case of the positive findings or single cases**

The animal is slaughtered and samples are taken for the laboratory (microbiological) isolation of M. bovis. Movement restrictions are imposed on the herd and the milk must be pasteurized. If the presence of tuberculosis is not confirmed laboratorily, the already applied movement restrictions are lifted following a negative test applied on all animals over six weeks of age. The test is conducted at least 42 days after the removal of the reactors animals. On the other hand if tuberculosis is laboratorily confirmed, movement restrictions are lifted when cleansing and disinfection of the premises and utensils has been completed and all animals over six weeks of age have reacted negatively to at least two consecutive tuberculin tests. The first one conducted not less than 60 days and the second not less than four months and no more than 12 after the removal of the last positive animal.

**Notification system in place**

It has always been a notifiable in Cyprus and by law any occurence of the disease is obligatory notifiable to the Veterinary Services. No case have been reported since 1928

**Results of the investigation**

122 out of the 330 holdings have been assigned the Officially Free Status in 2005 and no animal has reacted positively to the single intradermal testing.

**National evaluation of the recent situation, the trends and sources of infection**

122 out of the 330 holdings have been assigned the Officially Free Status in 2005 and no animal has reacted positively to the single intradermal testing.

Footnote

The interval between routine tuberculin tests is as provided by the EU Directive 64/432/EEC namely six months.
2.6. BRUCELLOSIS

2.6.1. General evaluation of the national situation

A. Brucellosis General evaluation

History of the disease and/or infection in the country

The causative agent of brucellosis in Cyprus at both bovine and sheep / goats is Brucella melitensis. Brucellosis caused by Brucella abortus has never been diagnosed in Cyprus (with the exception of the period 1921 to 1932, when it was imported in the island by cattle that were brought from the U.K.). As of 2001 a brucellosis eradication programme is applied on the area controlled by the Veterinary Services of the Republic of Cyprus.

Evolution of Brucellosis in Cyprus:
1930 to 1932
Brucellosis was found in goats imported from Malta (no spread)
1964
One outbreak in a bovine herd
1970 to 1973
Sporadic outbreaks
1973 to 1985
National Eradication program against Brucellosis
Successful test and slaughter eradication campaign
1985 1997
No outbreaks of the disease
1997 to 2000
Reappearance of the disease
2001
Beginning of Brucellosis Eradication and Elimination Project

National evaluation of the recent situation, the trends and sources of infection

According to the epidemiological data, from 2000 until the end of 2005, the prevalence and incidence of bovine, as well as, ovine and caprine brucellosis in Cyprus are decreasing.
Possible sources of infection in a herd or a flock are:
· the neighboring with known infected farms (most common)
· common use of machines
· illegal movements of animals from known infected farms
· sharing of pasture
· mechanical vectors (e.g. lorries of traders)

Relevance of the findings in animals, feedingstuffs and foodstuffs to human cases (as a source of infection)

There were 2 new human cases of brucellosis during 2005. Both were owners of known infected farms.

Recent actions taken to control the zoonoses
On the area controlled by the Veterinary Services of the Republic of Cyprus from 2001 is applied the brucellosis eradication programme.
2.6.2. Brucella in foodstuffs

2.6.3. Brucella in animals

A. Brucella abortus in Bovine Animals

Status as officially free of bovine brucellosis during the reporting year

Free regions

Monitoring system

Frequency of the sampling

Vaccination policy

B. Brucella melitensis in Goat

Monitoring system

Type of specimen taken

Other:

Vaccination policy

Vaccination is prohibited

C. B. melitensis in animal - Cattle (bovine animals)

Monitoring system

Sampling strategy

At infected and suspected herds sampling is targeted.
Concerning the other herds; sampling is part of a permanent monitoring scheme.
Samples are collected at farm level, by the employees of the Veterinary Services.

Frequency of the sampling

Infected farms: Monthly blood sampling of all animals over 12 months. Cultures from milk samples from the seropositive animals in new outbreaks and from fetuses (in any case of abortion)
Non infected farms: Cultures from milk samples and fetuses from aborting animals. Bulk milk samples every 3 months from all herds having more than 10 dairy cows. Blood sampling of all animals over 12 months old once a year in non officially free herds.
Farms with less than 10 individuals over 12 months old: Blood sampling of all animals over 12 months old twice a year in non officially free herds. For officially free herds blood sampling of all animals over 12 months old once a year.
Type of specimen taken
Other: Blood, Milk, Fetuses

Methods of sampling (description of sampling techniques)
Blood samples are taken by venipuncture from the caudal vein. Blood is collected in tubes (4 ml). Milk is collected in screw cup bottles (30 ml). Samples are stored at 2-40°C, for one week at the most for blood samples and 2-3 days for milk samples.

Case definition
As a positive case is defined a case when an animal reacts positively at Rose Bengal test and CFT test (> 20 ICFTU).

Diagnostic/analytical methods used
All materials, reagents and procedures used are based to the relevant EEC legislation (Dir 91/68/EEC and 64/432/EEC) and the OIE Manual of diagnostic tests and vaccines for terrestrial animals (mammals, birds and bees) 5th ed, 2004.

Bulk milk ELISA: Commercially available kits are used that fulfill the requirements of the references mentioned above. The procedures used are according to the manufacturers directions.
Rose Bengal test: 30 µl of serum and antigen are mixed on tiles to produce a zone of appr 2 cm. The mixture is rocked using a rotating shaker for 4 min and then observed for agglutination. Any degree of agglutination is considered positive. In each day test a positive and a negative control is used. The Rose Bengal antigen is commercially purchased and is manufactured according to the specifications given in the above mentioned references.
Complement fixation test: Dilution of serum starts from ¼ until 1/256, sera are inactivated in water bath in tubes and then transferred to 96 well U micro plates. Warm fixation follows. All reagents are commercially purchased and each time the batch or the company changes titration of the reagents takes place. In each day test controls of complement, antigen, blood as well as positive and negative controls are used. Also, for each sample examined there is anticomplimentary control.
Isolation: On Brucella medium incubating in 37°C with and without CO2. Confirmation on the species level: Dye of the colony with Gram and Stamp. Culture on Mc Conkey agar (lactose fermentation) and Blood agar (Haemolysis).

Vaccination policy
VACCINATION IS PROHIBITED

Other preventive measures than vaccination in place
All movements of animals should be reported and registered on a central database and are allowed only after a brucellosis negative serological examination.

Control program/mechanisms
The control program/strategies in place
The bovine brucellosis eradication program is based on a test and extended slaughter or killing of positive animals or positive herds, implemented in the area controlled by the Veterinary Services of the Republic of Cyprus. The target population of the programme is all bovine animals over 12 months old. The Department of Veterinary Services, which belongs to the Ministry of Agriculture, Environment and Natural Resources, is responsible for the application of the bovine brucellosis eradication program. The Director of the Veterinary Services is responsible for the coordination of the whole program. In 2004 and 2005 the EU has cofinanced the 50% of the programme. All the measures taken are according to Directive 64/432 EEC.

**Recent actions taken to control the zoonoses**

Application of brucellosis eradication programme.

**Measures in case of the positive findings or single cases**

Once there is a confirmation of a positive case:

a. The farm is placed under movement restrictions.

b. The milk collecting Organizations are notified so as the milk originating from the infected farms to be collected in separate milk tanks for pasteurization.

c. Seropositive bovines are isolated from the other animals to be slaughtered in the designated slaughterhouse. In case there is stamping out decision restocking is permitted after 6 months.

d. Seropositive animals are valued before slaughter. Compensations at a level of 100% of their reproductive value are paid to owners.

e. Dogs and animals of other species which are known to be susceptible to brucellosis are serologically examined too.

f. One month after the slaughter, all bovine animals over twelve months old are serologically reexamined.

g. Serological reexamination of the confirmed positive herds is performed every month, and the seropositive bovines are culled.

h. Farms’ cleaning and disinfection is done under the supervision of the Veterinary Services, with disinfectants being provided on a free basis by the Veterinary Services.

i. The pasture after being collected and disinfected is buried in a place far away from the establishments.

**Notification system in place**

Any case of abortion or other symptoms related to brucellosis are compulsory notifiable to Veterinary Services of the Republic of Cyprus, according to the animal health laws N. 109 (I)/2001 and N. 82(I)/2003.

**Results of the investigation**

Link to table 2.1.1.

**National evaluation of the recent situation, the trends and sources of infection**

According to the epidemiological data, from 2000 until the end of 2005, the prevalence and incidence of bovine brucellosis in Cyprus are decreasing. Possible sources of infection in a herd are:
· the neighboring with known infected herds (most common)
· common use of machines
· illegal movements of animals from known infected herd
· sharing of pasture
· mechanical vectors (e.g. lorries of traders)

**Relevance of the findings in animals to findings in foodstuffs and to human cases (as a source of infection)**

There were 2 new human cases of brucellosis during 2005. Both were owners of known infected farms.

**Additional information**

As far as it concerns the declaration of officially free herds 250 out of 334 have been declared officially free. The rest are under the procedure of granting the status.

**D. B. melitensis in animal - Sheep and goats**

**Monitoring system**

**Sampling strategy**

At infected and suspected flocks sampling is targeted. Concerning the other flocks; sampling is part of a permanent monitoring scheme. Samples are collected at farm level, by the employees of the Veterinary Services.

**Frequency of the sampling**

Infected farms: Monthly blood sampling of all animals over 6 months. Cultures from milk samples from the seropositive animals in new outbreaks and fetuses (in any case of abortion).
Non infected farms: Cultures from milk samples and fetuses from aborting animals. Blood sampling of all animals over 6 months old twice a year in non officially free farms. For officially free farms blood sampling of all animals over 6 months old or of an appropriate percentage of them once a year.

**Type of specimen taken**

Other: Blood, Milk, Fetuses

**Methods of sampling (description of sampling techniques)**

Blood samples are taken by venipuncture from the jugular vein. Blood is collected in tubes (4 ml). Milk is collected in screw cup bottles (30 ml). Samples are stored at 2-40°C, for one week at the most for blood samples and 2-3 days for milk samples.

**Case definition**

As a positive case is defined a case when an animal reacts positively at Rose Bengal test and / or CFT test (> 20 ICFTU).
**Diagnostic/analytical methods used**

All materials, reagents and procedures used are based to the relevant EEC legislation (Dir 91/68/EEC and 64/432/EEC) and the OIE Manual of diagnostic tests and vaccines for terrestrial animals (mammals, birds and bees) 5th ed, 2004.

Individual Screening Test: Rose Bengal test. 30 µl of serum and antigen are mixed on tiles to produce a zone of appr 2 cm. The mixture is rocked using a rotating shaker for 4 min and then observed for agglutination. Any degree of agglutination is considered positive. In each day test a positive and a negative control is used. The Rose Bengal antigen is commercially purchased and is manufactured according to the specifications given in the above mentioned references.

Individual Confirmation Test: Complement fixation test. Dilution of serum from ¼ until 1/256 is used, sera are inactivated in water bath in tubes and then transferred to 96 well U micro plates. Warm fixation follows. All reagents are commercially purchased and each time the batch or the company changes titration of the reagents takes place. In each day test controls of complement, antigen, blood as well as positive and negative controls are used. Also, for each sample examined there is anticomplimentary control. Isolation: On Brucella medium incubating in 37 C with and without CO2. Confirmation on the species level: Dye of the colony with Gram and Stamp. Culture on Mc Conkey agar (lactose fermentation) and Blood agar (Haemolysis).

**Vaccination policy**

VACCINATION IS PROHIBITED

**Other preventive measures than vaccination in place**

All movements of animals should be reported and registered on a central database and are allowed only after a brucellosis negative serological examination.

**Control program/mechanisms**

**The control program/strategies in place**

The ovine and caprine brucellosis eradication program is based on a test and extended slaughter or killing of positive animals or positive flocks, implemented in the area controlled by the Veterinary Services of the Republic of Cyprus. The target population of the programme is all animals over 6 months old. The Department of Veterinary Services, which belongs to the Ministry of Agriculture, Environment and Natural Resources, is responsible for the application of the ovine and caprine brucellosis eradication program. The Director of the Veterinary Services is responsible for the coordination of the whole program. In 2004 and 2005 the EU has cofinanced the 50% of the programme. All the measures taken are according to Directive 91/68 EEC.

**Recent actions taken to control the zoonoses**

Application of brucellosis eradication programme.

**Measures in case of the positive findings or single cases**

Once there is a confirmation of a positive case:
a. The farm is placed under movement restrictions.
b. The milk collecting Organizations are notified so as the milk originating from the infected farms to be collected in separate milk tanks for pasteurization.
c. Seropositive sheep and goats are isolated from the other animals to be slaughtered in the designated slaughterhouse. In case there is stamping out decision restocking is permitted after 6 months.
d. Seropositive animals are valued before slaughter. Compensations at a level of 100% of their reproductive value are paid to owners.
e. Dogs and animals of other species which are known to be susceptible to brucellosis are serologically examined too.
f. One month after the slaughter, all sheep and goats over six months old are serologically reexamined.
g. Serological reexamination of the confirmed positive flocks is performed every month, and the seropositive animals are culled.
h. Farms’ cleaning and disinfection is done under the supervision of the Veterinary Services, with disinfectants being provided on a free basis by the Veterinary Services.
i. The pasture after being collected and disinfected is buried in a place far away from the establishments.

Notification system in place

Any case of abortion or other symptoms related to brucellosis are compulsory notifiable to Veterinary Services of the Republic of Cyprus, according to the animal health laws N. 109 (I)/2001 and N. 82(I)/2003.

Results of the investigation

Link to table 2.1.2.

National evaluation of the recent situation, the trends and sources of infection

According to the epidemiological data, from 2000 until the end of 2005, the prevalence and incidence of ovine and caprine brucellosis in Cyprus are decreasing.

Possible sources of infection in a flock are:
- the neighboring with known infected herds (most common)
- common use of machines
- illegal movements of animals from known infected herd
- sharing of pasture
- mechanical vectors (e.g. lorries of traders)

Relevance of the findings in animals to findings in foodstuffs and to human cases (as a source of infection)

There were 2 new human cases of brucellosis during 2005.
Both were owners of known infected farms.

Additional information

As far as it concerns the declaration of officially free herds 2,196 out of 4,025 have been declared officially free. The rest are under the procedure of granting the status.

2.9. ECHINOCOCCOSIS

2.9.1. General evaluation of the national situation

A. Echinococcus spp general evaluation

National evaluation of the recent situation, the trends and sources of infection

During 2005 the control of Echinococcosis/Hydatidosis scheme has continued. Within this scheme, 32 dogs were preventively treated with Pranziquantel. 118060 ovines, 175300 caprines, 18687 bovines and 672456 swines had been slaughtered in 2005 of which 5 ovines, 1 caprine and bovine have been found to be infected with E. granulosus cysts.

Recent actions taken to control the zoonoses

During 2005, 11637 Pranziquantel baits were spread covering the buffer zone and other areas, where movement of stray dogs was reported.

2.11. RABIES

2.11.1. General evaluation of the national situation

A. Rabies General evaluation

History of the disease and/or infection in the country

Cyprus is free from Rabies

National evaluation of the recent situation, the trends and sources of infection

Cyprus is free from Rabies

Recent actions taken to control the zoonoses

Concerning the animals' entry into Cyprus either on a non commercial movement or on a commercial movement it is required that are duly vaccinated against Rabies.
The time period prior in which the vaccination should have taken place depends on the country of origin as provided by the EU Regulation 998/2003/EK and the related EU Decisions.
Animals originating from EU countries and third countries which are considered of equal to the EU member states Rabies status (mentioned in Part B, section 2 and Part C of Annex II of Regulation 998/2003/EK) are required to be vaccinated/revaccinated against Rabies at least 30 days prior departure for Cyprus.
Animals originating from third countries not mentioned in Part B, section 2 and Part C of Annex II are required to have a titer result of at least 0.5 IU/ml of Rabies Neutralising Antibodies (RNA) prior the animal departs for Cyprus.
The blood sampling should have taken place 30 days after Rabies vaccination/revaccination has taken place but not less than 90 days prior departure for Cyprus.
Animals originating from Cyprus and the other EU countries, taken on a trip to one of the third countries not mentioned in Part B, section 2 and Part C of Annex II of Regulation 998/2003/EK, and which will return to Cyprus are required to have a positive RNA blood titration test result prior leaving either Cyprus or the EU member for the trip to the third country.
Animals originating from Cyprus traveling to an EU country should be duly vaccinated or revaccinated against Rabies in order to reenter Cyprus.
2.11.2. Lyssavirus (rabies) in animals

A. Rabies in dogs

Monitoring system

Sampling strategy

Cyprus is free from Rabies.
Concerning the animals' entry into Cyprus either on a non commercial movement or on a commercial movement it is required that are duly vaccinated against Rabies. The time period prior in which the vaccination should have taken place depends on the country of origin as provided by the EU Regulation 998/2003/EK and the related EU Decisions.
Animals originating from EU countries and third countries which are considered of equal to the EU member states Rabies status (mentioned in Part B, section 2 and Part C of Annex II of Regulation 998/2003/EK) are required to be vaccinated/revaccinated against Rabies at least 30 days prior departure for Cyprus.
Animals originating from third countries not mentioned in Part B, section 2 and Part C of Annex II are required to have a titer result of at least 0.5 IU/ml of Rabies Neutralising Antibodies (RNA) prior the animal departs for Cyprus.
The blood sampling should have taken place 30 days after Rabies vaccination/revaccination has taken place but not less than 90 days prior departure for Cyprus.
Animals originating from Cyprus and the other EU countries, taken on a trip to one of the third countries not mentioned in Part B, section 2 and Part C of Annex II of Regulation 998/2003/EK, and which will return to Cyprus are required to have a positive RNA blood titration test result prior leaving either Cyprus or the EU member for the trip to the third country.
Animals originating from Cyprus traveling to an EU country should be duly vaccinated or revaccinated against Rabies in order to reenter Cyprus.

Frequency of the sampling

Blood Sampling is done for dogs which are to travel to a third country not mentioned in Part B, section 2 and Part C of Annex II of Regulation 998/2003/EK and which will enter/return back to Cyprus.

Type of specimen taken

Blood

Methods of sampling (description of sampling techniques)

Blood is sampled and the blood sampling should have taken place 30 days after Rabies vaccination/revaccination has taken place but not less than 90 days prior departure for Cyprus. The blood sample should be sent to one of the EU recognised laboratories for evaluating the Rabies Neutralising Antibodies titer.
Case definition

As Rabies case is considered an animal which shows symptoms attributed to Rabies virus and from whose the CNS Negri virus particles are detected histopathologically.

Diagnostic/analytical methods used

Other: Hellers stain

Vaccination policy

Rabies vaccination is voluntary as Cyprus is free from Rabies. In case the animal is to travel abroad and in order for it to reenter free, the relevant Rabies vaccination and/or antibodies titration should take place within the required time frame, as provided by the provisions in force (www.moa.gov.cy/vs Useful Information link).

Other preventive measures than vaccination in place

Quarantine

Control program/mechanisms

The control program/(strategies in place

The relevant checks are performed by both the Customs Department and the Veterinary Services upon the animals arrival at the Republic of Cyprus' official points of entry.

Measures in case of the positive findings or single cases

The suspect animal is euthanised and confiscated for further examination by the Veterinary Services. Any possible human or animal contact with the suspect animal is traced back and appropriately treated in case of humans. As far as animals is concerned they are confiscated and isolated so as to safeguard the proper handling in case of new positive cases.

Notification system in place

Mandatory Notifiable

Results of the investigation

Investigations of the human contacts with positive cases

Any human contacts in case of a rabies incidence are traced and appropriately checked by the Public Health Services of the Ministry of Health.

National evaluation of the recent situation, the trends and sources of infection

Cyprus is free from Rabies
