MALTA

The Report referred to in Article 9 of Directive 2003/99/EC

TRENDS AND SOURCES OF ZOONOSES AND ZOONOTIC AGENTS IN HUMANS, FOODSTUFFS, ANIMALS AND FEEDINGSTUFFS

including information on foodborne outbreaks and antimicrobial resistance in zoonotic agents

IN 2005
INFORMATION ON THE REPORTING AND MONITORING SYSTEM

Country: Malta

Reporting Year: 2005

This report is submitted to the European Commission in accordance with Article 9 of Council Directive 2003/99/EC. The information has also been forwarded to the European Food Safety Authority (EFSA).

The report contains information on trends and sources of zoonoses and zoonotic agents in Malta during the year 2005. The information covers the occurrence of these diseases and agents in humans, animals, foodstuffs and in some cases also in feedingstuffs. In addition the report includes data on antimicrobial resistance in some zoonotic agents and commensal bacteria as well as information on epidemiological investigations of foodborne outbreaks. Complementary data on susceptible animal populations in the country is also given.

The information given covers both zoonoses that are important for the public health in the whole European Community as well as zoonoses, which are relevant on the basis of the national epidemiological situation.

The report describes the monitoring systems in place and the prevention and control strategies applied in the country. For some zoonoses this monitoring is based on legal requirements laid down by the Community Legislation, while for the other zoonoses national approaches are applied.

The report presents the results of the examinations carried out in the reporting year. A national evaluation of the epidemiological situation, with special reference to trends and sources of zoonotic infections, is given. Whenever possible, the relevance of findings in foodstuffs and animals to zoonoses cases in humans is evaluated.

The information covered by this report is used in the annual Community Summary Report on zoonoses that is published each year by EFSA.

1. ANIMAL POPULATIONS

The relevance of the findings on zoonoses and zoonotic agents has to be related to the size and nature of the animal population in the country.

A. Information on susceptible animal population

Sources of information:

Information gathered by the Food and Veterinary Regulation Division. Information of Bovine population as on National Bovine Database. Other animal population estimated according to census carried out on farms throughout the year.

Dates the figures relate to and the content of the figures:

The figures represent the average live population throughout the year.

Geographical distribution and size distribution of the herds, flocks and holdings

All holdings are distributed evenly over the whole territory, except for swine reproducers which are isolated on the uninhabited island of Comino.

(1): The population figure also includes layers on mixed holdings.
(2): The population figure also includes broilers on mixed holdings.
2. INFORMATION ON SPECIFIC ZOONOSES AND ZOONOTIC AGENTS

Zoonoses are diseases or infections, which are naturally transmissible directly or indirectly between animals and humans. Foodstuffs serve often as vehicles of zoonotic infections. Zoonotic agents cover viruses, bacteria, fungi, parasites or other biological entities that are likely to cause zoonoses.
2.1. SALMONELLOSIS

2.1.1. General evaluation of the national situation

2.1.2. Salmonella in foodstuffs

2.1.3. Salmonella in animals

2.1.4. Salmonella in feedingstuffs
2.1.5. Salmonella serovars and phagetype distribution
2.1.6. Antimicrobial resistance in Salmonella isolates

The methods of collecting, isolating and testing of the Salmonella isolates are described in the chapters above respectively for each animal species, foodstuffs and humans. The serotype and phagetype distributions can be used to investigate the sources of the Salmonella infections in humans. Findings of same serovars and phagetypes in human cases and in foodstuffs or animals may indicate that the food category or animal species in question serves as a source of human infections. However as information is not available from all potential sources of infections, conclusions have to be drawn with caution.
2.2. CAMPYLOBACTERIOSIS

2.2.1. General evaluation of the national situation

2.2.2. Campylobacter, thermophilic in foodstuffs

2.2.3. Campylobacter, thermophilic in animals

2.2.4. Antimicrobial resistance in Campylobacter, thermophilic isolates
2.3. LISTERIOSIS

2.3.1. General evaluation of the national situation

A. Listeriosis general evaluation

History of the disease and/or infection in the country

The tests carried out in 2004 were part of a study that was carried out to evaluate the incidence of Listeria spp. in traditional cheeselet production in Malta. This was the first time that such a study was undertaken in Malta. It is hoped that this study can be extended to cover more farms over a longer period of production for several years. In 2005, the study was not performed.
2.3.2. Listeria in foodstuffs

2.3.3. Listeria in animals
2.4. E. COLI INFECTIONS

2.4.1. General evaluation of the national situation

2.4.2. Escherichia coli, pathogenic in foodstuffs

2.4.3. Escherichia coli, pathogenic in animals
2.5. TUBERCULOSIS, MYCOBACTERIAL DISEASES

2.5.1. General evaluation of the national situation

2.5.2. Mycobacterium in animals

A. Mycobacterium bovis in Bovine Animals

Status as officially free of bovine tuberculosis during the reporting year

Additional information

Even though there have been no cases of Tuberculosis in bovines for more than ten years, Malta has not yet obtained recognition as officially free from bovine tuberculosis.

Monitoring system

Sampling strategy

Bovines on dairy cattle farms are tested on a yearly basis by means of the intradermal comparative test.

Frequency of the sampling

Once a year

Type of specimen taken

Other: Intradermal test

Methods of sampling (description of sampling techniques)

Two 0.1ml doses, one of protein purified derivative (PPD) of bovine tuberculin and one of PPD of avian tuberculin are injected in the intradermal layer of the skin in the neck region of the bovine.

Case definition

Positive when the Bovine PPD injection site swells up 4 mm or more than the avian PPD injection site; Dubious when the Bovine PPD injection site swells up from 2 mm to 4 mm more than the avian PPD injection site; to be measured by means of skin calipers.

Diagnostic/analytical methods used

n/a

Vaccination policy

n/a

Measures in case of the positive findings or single cases
Positive cases: slaughtered; the herd is retested two months later.
Dubious cases: isolation; the animal is retested two months later.

</tbody>
</table>

**Footnote**

Dairy herds are tested for tuberculosis on a yearly basis.
Malta has not yet obtained officially free status for bovine tuberculosis.
2.6. BRUCELLOSIS

2.6.1. General evaluation of the national situation

2.6.2. Brucella in foodstuffs

2.6.3. Brucella in animals

A. Brucella abortus in Bovine Animals

Status as officially free of bovine brucellosis during the reporting year

The entire country free

Malta has not obtained recognition as Officially free from Brucellosis. However the last outbreak of Brucellosis was during 1996, and no other cases were detected since this date.

Free regions

The two islands of Malta and Gozo are considered as one region.

Monitoring system

Sampling strategy

Serum samples from adult bovines at holdings. Serum samples from bovines prior to slaughter.

Frequency of the sampling

Yearly basis on holdings.

Type of specimen taken

Blood

Methods of sampling (description of sampling techniques)

A blood sample is taken from the caudal vein by staff of the Food and Veterinary Regulation Division.

Diagnostic/analytical methods used

Serum samples are tested using RBT (Rose Bengal Test). Any positive reactions are retested using CFT (Complement Fixation Test).

Vaccination policy

No vaccination against brucellosis takes place in the Maltese territory.

Other preventive measures than vaccination in place
Movement restrictions from holdings under suspicion.

**Control program/mechanisms**

**The control program/strategies in place**

All holdings are tested on a yearly basis.

**Measures in case of the positive findings or single cases**

Any bovine which tests positive to the CFT test is slaughtered. All bovines on the holding are retested after 3 weeks. In the mean time, movement restrictions are introduced on the holding.

**B. Brucella melitensis in Sheep**

**Status as officially free of ovine brucellosis during the reporting year**

**The entire country free**

Malta has not obtained recognition as Officially free from Brucellosis. However the last outbreak of Brucellosis was during 1996, and no other cases were detected since this date.

**Free regions**

The two islands of Malta and Gozo are considered as one region.

**Monitoring system**

**Sampling strategy**

Serum samples from ovines at holdings. Serum samples from ovines prior to slaughter.

**Frequency of the sampling**

Twice-yearly basis on holdings.

**Type of specimen taken**

Blood

**Methods of sampling (description of sampling techniques)**

A blood sample is taken from the jugular vein by staff of the Food and Veterinary Regulation Division.

**Diagnostic/analytical methods used**

Serum samples are tested using RBT (Rose Bengal Test). Any positive reactions are retested using CFT (Complement Fixation Test).

**Vaccination policy**

No vaccination against brucellosis takes place in the Maltese territory.
Other preventive measures than vaccination in place

Movement restrictions from holdings under suspicion.

Control program/mechanisms

The control program стрategies in place

All holdings are tested on a twice-yearly basis.

Measures in case of the positive findings or single cases

Any ovine which tests positive to the CFT test is slaughtered. All ovines on the holding are retested after 3 weeks. In the mean time, movement restrictions are introduced on the holding.

C. Brucella melitensis in Goat

Status as officially free of caprine brucellosis during the reporting year

The entire country free

Malta has not obtained recognition as Officially free from Brucellosis. However the last outbreak of Brucellosis was during 1996, and no other cases were detected since this date.

Free regions

The two islands of Malta and Gozo are considered as one region.

Monitoring system

Sampling strategy

Serum samples from ovines at holdings. Serum samples from caprines prior to slaughter.

Frequency of the sampling

Twice-yearly basis on holdings.

Type of specimen taken

Blood

Methods of sampling (description of sampling techniques)

A blood sample is taken from the jugular vein by staff of the Food and Veterinary Regulation Division.

2.9. ECHINOCOCCOSIS

2.9.1. General evaluation of the national situation

2.9.2. Echinococcus in animals
2.10. **TOXOPLASMOSIS**

2.10.1. General evaluation of the national situation

2.10.2. Toxoplasma in animals
2.11. RABIES

2.11.1. General evaluation of the national situation

A. Rabies General evaluation

History of the disease and/or infection in the country

Malta has been free from Rabies since the year 1911. Due to its geographical isolation from other countries, rabies can only enter the islands via infected animals being transported. For this reason Malta has had a very strict quarantine system to prevent the entry of Rabies. Nowadays Malta is in the Pet Travel Scheme and requires dogs and cats entering from other countries to be vaccinated against rabies and to be tested for rabies antibodies at least six months before entering the Maltese territory.

Recent actions taken to control the zoonoses

Malta is in the Pet Travel Scheme. Animals may enter the Maltese territory without remaining in quarantine so long as they possess a valid passport which entails vaccination against rabies and a blood test for rabies antibodies performed at least six months before entering Malta.
2.11.2. Lyssavirus (rabies) in animals

A. Rabies in dogs

Additional information

Only vaccinated dogs are tested for rabies so as to be eligible to travel with the Pet Travel Scheme.
3. INFORMATION ON SPECIFIC INDICATORS OF ANTIMICROBIAL RESISTANCE
3.1. *ESCHERICHIA COLI, NON-PATHOGENIC*

3.1.1. General evaluation of the national situation

3.1.2. Antimicrobial resistance in *Escherichia coli*, non-pathogenic isolates
4. FOODBORNE OUTBREAKS

Foodborne outbreaks are incidences of two or more human cases of the same disease or infection where the cases are linked or are probably linked to the same food source. Situation, in which the observed human cases exceed the expected number of cases and where a same food source is suspected, is also indicative of a foodborne outbreak.
