

EFSA OPEX model

Issues encountered

Carla Huizing, Ctgb The Netherlands

ctgb

Problems

The new version is less transparent and more rigid.

Examples:

- Worker: There is a possibility to calculate the re-entry period for a safe use. However, only the number of days is presented, not the associated exposure.
- Residents: It is not possible to check the mean exposure for a route. Only the 75 percentile is presented.
- MAF cannot be set up manually
- It is not possible to choose your own combinations of PPE

ctgb

A collage of three images is positioned on the left side of the slide. The top image shows a butterfly with orange and black wings perched on a green leaf. The middle image shows a plant with thick, red, tuberous roots. The bottom image shows a landscape with a pond, green grass, and a distant building.

Discussion

Do other MSs face the same (or additional) problems?
